

Arithmetic Expressions

5-year-old Shinnchan had just started learning mathematics. Meanwhile, one of his studious classmates, Kazama, had already written a basic calculator which supports only three operations on integers: *multiplication* (\times), *addition* ($+$), and *subtraction* ($-$). Since he had just learned about these operations, he didn't know about operator precedence, and so, in his calculator, all operators had the same precedence and were left-associative.

As always, Shinnchan started to irritate him with his silly questions. He gave Kazama a list of n integers and asked him to insert one of the above operators between each pair of consecutive integers such that the result obtained after feeding the resulting expression in Kazama's calculator is divisible by **101**. At his core, Shinnchan is actually a good guy, so he only gave lists of integers for which an answer exists.

Can you help Kazama create the required expression? If multiple solutions exist, print any one of them.

Input Format

The first line contains a single integer n denoting the number of elements in the list. The second line contains n space-separated integers a_1, a_2, \dots, a_n denoting the elements of the list.

Constraints

- $2 \leq n \leq 10^4$
- $1 \leq a_i \leq 100$
- The length of the output expression should not exceed $10n$.

Output Format

Print a single line containing the required expression. You may insert spaces between operators and operands.

Note

- You are not allowed to permute the list.
- All operators have the same precedence and are left-associative, e.g., $a + b \times c - d \times e$ is interpreted as $((((a + b) \times c) - d) \times e)$
- Unary plus and minus are not supported, e.g., statements like $-a$, $a \times -b$, or $-a \times b + c$ are invalid.

Sample Input 0

```
3
22 79 21
```

Sample Output 0

22*79-21

Explanation 0

Solution 1: $22 \times 79 - 21 = 1717$, where $1717 \div 101 = 17$, so it is perfectly divisible by **101**.

Solution 2: $22 + 79 \times 21 = (22 + 79) \times 21 = 2121$, which is also divisible by **101**.

Sample Input 1

5
55 3 45 33 25

Sample Output 1

55+3-45*33-25

Explanation 1

$55 + 3 - 45 \times 33 - 25 = (((55 + 3) - 45) \times 33) - 25 = 404$ which is divisible by **101**.
