## Frequency Queries

You are given $q$ queries. Each query is of the form two integers described below:

- $1 x$ : Insert x in your data structure.
- $2 y$ : Delete one occurence of $y$ from your data structure, if present.
- $3 z$ : Check if any integer is present whose frequency is exactly $z$. If yes, print 1 else 0 .

The queries are given in the form of a 2-D array queries of size $q$ where queries $[i][0]$ contains the operation, and queries $[i][1]$ contains the data element.

## Example

queries $=[(1,1),(2,2),(3,2),(1,1),(1,1),(2,1),(3,2)]$
The results of each operation are:

| Operation | Array | Output |
| :--- | :--- | :---: |
| $(1,1)$ | $[1]$ |  |
| $(2,2)$ | $[1]$ | 0 |
| $(3,2)$ |  |  |
| $(1,1)$ | $[1,1]$ |  |
| $(1,1)$ | $[1,1,1]$ |  |
| $(2,1)$ | $[1,1]$ |  |
| $(3,2)$ |  | 1 |

Return an array with the output: $[0,1]$.

## Function Description

Complete the freqQuery function in the editor below.
freqQuery has the following parameter(s):

- int queries[q][2]: a 2-d array of integers

## Returns

- int[]: the results of queries of type 3

## Input Format

The first line contains of an integer $q$, the number of queries.
Each of the next $q$ lines contains two space-separated integers, queries $[i][0]$ and queries $[i][1]$.

## Constraints

- $1 \leq q \leq 10^{5}$
- $1 \leq x, y, z \leq 10^{9}$
- All queries $[i][0] \in\{1,2,3\}$
- $1 \leq q u e r i e s[i][1] \leq 10^{9}$

## Sample Input 0

```
8
5
6
2
10
10
6
5
3
```

## Sample Output 0

0
1

## Explanation 0

For the first query of type 3 , there is no integer whose frequency is 2 (array $=[5,6]$ ). So answer is 0 . For the second query of type 3 , there are two integers in array $=[6,10,10,6]$ whose frequency is 2 (integers $=6$ and 10 ). So, the answer is 1 .

## Sample Input 1

```
4
4
1003
16
1
```

## Sample Output 1

0
1

## Explanation 1

For the first query of type 3 , there is no integer of frequency 4 . The answer is 0 . For the second query of type 3 , there is one integer, 16 of frequency 1 so the answer is 1 .

## Sample Input 2

[^0]
## Explanation 2

When the first output query is run, the array is empty. We insert two 4's and two 5's before the second output query, $\operatorname{arr}=[4,5,5,4]$ so there are two instances of elements occurring twice. We delete a 4 and run the same query. Now only the instances of 5 satisfy the query.

[^0]:    10
    13
    23
    32
    14
    15
    15
    14
