

# Java Static\_INITIALIZER Block

Static initialization blocks are executed when the class is loaded, and you can initialize static variables in those blocks.

It's time to test your knowledge of *Static initialization blocks*. You can read about it [here](#).

You are given a class *Solution* with a *main* method. Complete the given code so that it outputs the area of a parallelogram with breadth *B* and height *H*. You should read the variables from the standard input.

If  $B \leq 0$  or  $H \leq 0$ , the output should be `"java.lang.Exception: Breadth and height must be positive"` without quotes.

## Input Format

There are two lines of input. The first line contains *B*: the breadth of the parallelogram. The next line contains *H*: the height of the parallelogram.

## Constraints

- $-100 \leq B \leq 100$
- $-100 \leq H \leq 100$

## Output Format

If both values are greater than zero, then the *main* method must output the area of the *parallelogram*. Otherwise, print `"java.lang.Exception: Breadth and height must be positive"` without quotes.

## Sample input 1

```
1
3
```

## Sample output 1

```
3
```

## Sample input 2

```
-1
2
```

## Sample output 2

```
java.lang.Exception: Breadth and height must be positive
```
