## Super Maximum Cost

Victoria has a tree, $T$, consisting of $N$ nodes numbered from 1 to $N$. Each edge from node $U_{i}$ to $V_{i}$ in tree $T$ has an integer weight, $W_{i}$.

Let's define the cost, $C$, of a path from some node $X$ to some other node $Y$ as the maximum weight ( $W$ ) for any edge in the unique path from node $X$ to node $Y$.

Victoria wants your help processing $Q$ queries on tree $T$, where each query contains 2 integers, $L$ and $R$ , such that $L \leq R$. For each query, she wants to print the number of different paths in $T$ that have a cost, $C$, in the inclusive range $[L, R]$.

It should be noted that path from some node $X$ to some other node $Y$ is considered same as path from node $Y$ to $X$ i.e $\{X, Y\}$ is same as $\{Y, X\}$.

## Input Format

The first line contains 2 space-separated integers, $N$ (the number of nodes) and $Q$ (the number of queries), respectively.
Each of the $N-1$ subsequent lines contain 3 space-separated integers, $U, V$, and $W$, respectively, describing a bidirectional road between nodes $U$ and $V$ which has weight $W$.
The $Q$ subsequent lines each contain 2 space-separated integers denoting $L$ and $R$.

## Constraints

- $1 \leq N, Q \leq 10^{5}$
- $1 \leq U, V \leq N$
- $1 \leq W \leq 10^{9}$
- $1 \leq L \leq R \leq 10^{9}$

## Scoring

- $1 \leq N, Q \leq 10^{3}$ for $30 \%$ of the test data.
- $1 \leq N, Q \leq 10^{5}$ for $100 \%$ of the test data.

## Output Format

For each of the $Q$ queries, print the number of paths in $T$ having cost $C$ in the inclusive range $[L, R]$ on a new line.

## Sample Input

```
5
2 3
142
```

## Sample Output

## Explanation

$$
Q_{1}:\{3,4\}
$$

$Q_{2}:\{1,3\},\{3,4\},\{1,4\}$
$Q_{3}:\{1,4\},\{1,2\},\{2,4\},\{1,3\},\{2,3\}$
$Q_{4}:\{1,4\},\{1,2\},\{2,4\},\{1,3\},\{2,3\}$
...etc.
