

# No Prefix Set

There is a given list of strings where each string contains only lowercase letters from  $a - j$ , inclusive. The set of strings is said to be a **GOOD SET** if no string is a prefix of another string. In this case, print **GOOD SET**. Otherwise, print **BAD SET** on the first line followed by the string being checked.

**Note** If two strings are identical, they are prefixes of each other.

### Example

*words* = ['abcd', 'bcd', 'abcde', 'bcde']

Here 'abcd' is a prefix of 'abcde' and 'bcd' is a prefix of 'bcde'. Since 'abcde' is tested first, print

```
BAD SET
abcde
```

*words* = ['ab', 'bc', 'cd'].

No string is a prefix of another so print

```
GOOD SET
```

### Function Description

Complete the *noPrefix* function in the editor below.

*noPrefix* has the following parameter(s):

- *string words[n]*: an array of strings

### Prints

- *string(s)*: either **GOOD SET** or **BAD SET** on one line followed by the word on the next line. No return value is expected.

### Input Format

First line contains  $n$ , the size of *words* [].  
Then next  $n$  lines each contain a string, *words* [*i*].

### Constraints

- $1 \leq n \leq 10^5$
- $1 \leq \text{length of words}[i] \leq 60$
- All letters in *words* [*i*] are in the range 'a' through 'j', inclusive.

### Sample Input00

| STDIN  | Function   |
|--------|--|
| -----  | -----  |
| 7      | words[] size n = 7   |
| aab    | words = ['aab', 'defgab', 'abcde', 'aabcde', 'bbbbbbbbbb', 'jabjjjad'] |
| defgab |  |
| abcde  |  |
| aabcde |  |

```
cedaaa  
bbbbbbbbbb  
jabjjjad
```

## Sample Output00

```
BAD SET  
aabcde
```

## Explanation

'aab' is prefix of 'aabcde' so it is a **BAD SET** and fails at string 'aabcde'.

## Sample Input01

```
4  
aab  
aac  
aacghgh  
aabghgh
```

## Sample Output01

```
BAD SET  
aacghgh
```

## Explanation

'aab' is a prefix of 'aabghgh', and 'aac' is prefix of 'aacghgh'. The set is a **BAD SET**. 'aacghgh' is tested before 'aabghgh', so and it fails at 'aacghgh'.
