

`regex_1(?=regex_2)`

The positive lookahead (`?=`) asserts `regex_1` to be immediately followed by `regex_2`. The lookahead is excluded from the match. It does not return matches of `regex_2`. The lookahead only asserts whether a match is possible or not.

In the above image, the Regex Pattern is matched with the Test String.

Task

You have a test string *S*.
Write a regex that can match all occurrences of `o` followed immediately by `oo` in *S*.

Note

This is a regex only challenge. You are not required to write code.
You have to fill the regex pattern in the blank ().
