Range Minimum Query (RMQ) is a set of problems which deals with finding a property (here minimum) of a range. Segment Tree can be very helpful when solving with such problems. A segment tree is a tree like data structure which is used to store the information about intervals. Here's the [(wiki link)] of it.

You are given a array of $N$ integers, $\operatorname{arr}[0], \operatorname{arr}[1], . ., \operatorname{arr}[(N-1)]$. And you are given a list of ranges. For each range, $(I, r)$ you have to find the minimum value between range $\operatorname{arr}[I], \operatorname{arr}[I+1], \operatorname{arr}[I+2], . ., \operatorname{arr}[r]$.

## Input

First line will contain two integers, $N M$, length of array and number of queries. Then in next line, there are N space separated integers which represent the array, $\operatorname{arr}[0], \operatorname{arr}[1], . ., \operatorname{arr}[N-1]$. Then $M$ line follows. Each $M$ line will contain two integers, I r, representing a range.

## Output

For each range, $(I, r)$, you have to print the minimum integer in subarray $\operatorname{arr}[I]$, $\operatorname{arr}[I+1]$, .., arr[r] in separate line.

## Constraints

$1<=N, M<=10^{5}$
$-10^{5}<=\operatorname{arr}[i]<=10^{5}$, where $0<=i<N$
$0<=\mid<=r<N$

## Sample Input

```
5
10
```

05
12
89
09
46

## Sample Output

```
10
20
5
5
1 1
```

## Explanation

- For range $(0,5)$, subarray will be $[10,20,30,40,11,22]$. So minimum value will be 10 .
- For range (1, 2), subarray will be [20,30]. Minimum value $=20$.
- For range $(8,9)$, subarray is $[15,5]$. Minimum value $=5$.
- For range $(0,9)$, Here we have to find the minimum (5) of the whole array.
- For range $(3,5)$, subarray is $[40,11,22]$. Minimum value $=11$.
