## Rectangular Game

You are given an infinite 2-d grid with the bottom left cell referenced as (1,1). All the cells contain a value of zero initially. Let's play a game?

The game consists of $\mathbf{N}$ steps wherein each step you are given two integers $\mathbf{a}$ and $\mathbf{b}$. The value of each of the cells in the co-ordinate ( $u, v$ ) satisfying $1 \leq u \leq a$ and $1 \leq v \leq b$, is increased by 1 . After $\mathbf{N}$ such steps, if $\mathbf{X}$ is the largest number amongst all the cells in the rectangular board, can you print the number of $\mathbf{X}$ 's in the board?

## Input Format

The first line of input contains a single integer N . N lines follow.
Each line contains two integers $a$ and $b$ separated by a single space.

## Output Format

Output a single integer - the number of X's.

## Constraints

$1 \leq N \leq 100$
$1 \leq \mathrm{a} \leq 10^{6}$
$1 \leq \mathrm{b} \leq 10^{6}$

## Sample Input

```
3
2 3
3
4
```

## Sample Output

2

## Explanation

Assume that the following board corresponds to cells ( $\mathrm{i}, \mathrm{j}$ ) where $1 \leq \mathrm{i} \leq 4$ and $1 \leq \mathrm{j} \leq 7$.
At the beginning board is in the following state:

```
0}00000000
0
0
0}00000000
```

After the first step we will obtain:

```
0 0 0 0 0 0 0
0}0000000
```

After the second step we will obtain:

```
0}00000000
1
2
2 2 2 1 1 1 1
```

Finally, after the last step we will obtain:

```
1 0}0000000
2
3
```

So, the maximum number is 3 and there are exactly two cells which correspond to 3 . Hence 2.
