Reduce a string of lowercase characters in range ascii [ 'a' . ' $z^{\prime}$ ] by doing a series of operations. In each operation, select a pair of adjacent letters that match, and delete them.

Delete as many characters as possible using this method and return the resulting string. If the final string is empty, return Empty String

## Example.

$s=$ 'aab'
aab shortens to b in one operation: remove the adjacent a characters.
$s=$ 'abba'
Remove the two 'b' characters leaving 'aa'. Remove the two 'a' characters to leave '. Return 'Empty String'.

## Function Description

Complete the superReducedString function in the editor below.
superReducedString has the following parameter(s):

- string s: a string to reduce

## Returns

- string: the reduced string or Empty String

## Input Format

A single string, $s$.

## Constraints

- $1 \leq$ length of $s \leq 100$

## Sample Input 0

```
aaabccddd
```

## Sample Output 0

```
abd
```

## Explanation 0

Perform the following sequence of operations to get the final string:

## Sample Input 1

aa

## Sample Output 1

Empty String

## Explanation 1

aa $\rightarrow$ Empty String

## Sample Input 2

baab

## Sample Output 2

Empty String

## Explanation 2
