

Relational MapReduce Patterns #1 - Intersections

Mappers and Reducers

[Here's](#) a quick but comprehensive introduction to the idea of splitting tasks into a MapReduce model. The four important functions involved are:

```
Map (the mapper function)
EmitIntermediate(the intermediate key,value pairs emitted by the mapper functions)
Reduce (the reducer function)
Emit (the final output, after summarization from the Reduce functions)
```

We provide you with a single system, single thread version of a basic MapReduce implementation.

Task

Given two sets of integers, **R** and **S** select and display the intersection. The relative ordering of integers in the intersecting set should be same as that in set **R**.

The code for the MapReduce class, reading and splitting the text, parts related to IO etc. has already been provided. However, for this particular task, you ONLY need parts of the mapper and its related functions. However certain parts of the mapper and reducer functions are incomplete. You need to replace the questionmarks (?). Your task is to fill up these question marks appropriately, such that the program works and performs the specified task.

Also, this program may output certain information to the error stream. This information has been logged to help beginners gain a better understanding of the the intermediate steps in a map-reduce process.

Input Format

The first line contains two space separated integers **Nr** and **Ns**, which are the number of elements in the set **R** and **S** respectively. This is followed by **Nr** integers, the elements of set **R**, each on a new line, such that $-100 \leq X \leq 100$. This is followed by **Ns** integers, the elements of set **S**, each on a new line, such that $-100 \leq X \leq 100$. Also, $10 \leq Nr, *Ns* \leq 100$

For instance, if **R** = [10,20,40,20,60];you may treat it as [10,20,40,60]

Output Format

Output each of the integers in the intersection of the sets **R** and **S**. The relative ordering of integers in the intersecting set should be same as that in set **R**.

Sample Input

```
10 10
-51
-43
74
```

```
-96
24
-14
11
77
-45
-90
45
8
29
0
-43
-13
-72
71
-96
-26
```

Sample Output

```
-43
-96
```

Explanation

We have two arrays with 10 elements each. -43 and -96 are the only common elements.
