## Two Robots

You have a warehouse with $M$ containers filled with an infinite number of candies. The containers are arranged in a single row, equally spaced to be 1 meter apart. You also have 2 robots that can pick up 1 piece of candy and transport it between any two containers.

The robots take instructions in the form of queries consisting of two integers, $M_{a}$ and $M_{b}$, respectively. To execute a query, a robot travels to container $M_{a}$, picks up 1 candy, transports it to container $M_{b}$, and then stops at $M_{b}$ until it receives another query.

Calculate the minimum total distance the robots must travel to execute $N$ queries in order.
Note: You choose which robot executes each query.

## Input Format

The first line contains a single integer, $T$ (the number of test cases); each of the $T$ test cases is described over $N+1$ lines.

The first line of a test case has two space-separated integers, $M$ (the number of containers) and $N$ (the number of queries).
The $N$ subsequent lines each contain two space-separated integers, $M_{a}$ and $M_{b}$, respectively; each line $N_{i}$ describes the $i^{\text {th }}$ query.

## Constraints

- $1 \leq T \leq 50$
- $1<M \leq 1000$
- $1 \leq N \leq 1000$
- $1 \leq a, b \leq M$
- $M_{a} \neq M_{b}$

## Output Format

On a new line for each test case, print an integer denoting the minimum total distance that the robots must travel to execute the queries in order.

## Sample Input

## Sample Output

$\square$

## Explanation

In this explanation, we refer to the two robots as $R_{1}$ and $R_{2}$, each container $i$ as $M_{i}$, and the total distance traveled for each query $j$ as $D_{j}$.

Note: For the first query a robot executes, there is no travel distance. For each subsequent query that robot executes, it must travel from the location where it completed its last query.

Test Case 0:
The minimum distance traveled is 11 :

- Robot: $R_{1}$

$$
\begin{aligned}
& M_{1} \rightarrow M_{5} \\
& D_{0}=|1-5|=4 \text { meters. }
\end{aligned}
$$

- Robot: $R_{2}$
$M_{3} \rightarrow M_{2}$
$D_{1}=|3-2|=1$ meter.
- Robot: $R_{1}$
$M_{5} \rightarrow M_{4} \rightarrow M_{1}$
$D_{2}=|5-4|+|4-1|=1+3=4$ meters.
- Robot: $R_{2}$

$$
\begin{aligned}
& M_{2} \rightarrow M_{2} \rightarrow M_{4} \\
& D_{3}=|2-2|+|2-4|=0+2=2 \text { meters. }
\end{aligned}
$$

Sum the distances traveled ( $D_{0}+D_{1}+D_{2}+D_{3}=4+1+4+2=11$ ) and print the result on a new line.

Test Case 1:

- Robot: $R_{1}$
$M_{1} \rightarrow M_{2}$
$D_{0}=|1-2|=1$ meters.
- Robot: $R_{2}$
$M_{4} \rightarrow M_{3}$
$D_{1}=|4-3|=1$ meters.
Sum the distances traveled ( $D_{0}+D_{1}=1+1=2$ ) and print the result on a new line.
Test Case 2:
- Robot: $R_{1}$
$M_{2} \rightarrow M_{4}$
$D_{0}=|2-4|=2$ meters.
- Robot: $R_{1}$
$M_{4} \rightarrow M_{5} \rightarrow M_{4}$
$D_{1}=|4-5|+|5-4|=1+1=2$ meters.
- Robot: $R_{2}$
$M_{9} \rightarrow M_{8}$
$D_{2}=|9-8|=1$ meters.
Sum the distances traveled ( $D_{0}+D_{1}+D_{2}=2+2+1=5$ ) and print the result on a new line.
